

DIGITAL VACCINATION VERIFICATION

Covid-19 vaccination programs must work effectively. To do so, every regimen must be administered completely and uniformly.

The Problem: Hundreds of millions of people run the risk of not being treated proper or verified.

Health Care Providers (HCPs) will become overwhelmed administering billions of doses. “Non traditional” HCPs like a Military, large brand pharmacies, grocery stores or walk-in clinics will need to act as point of care providers. Completing and verifying that full protocol was completed will save lives and significant cost.

The Solution: VXPASS

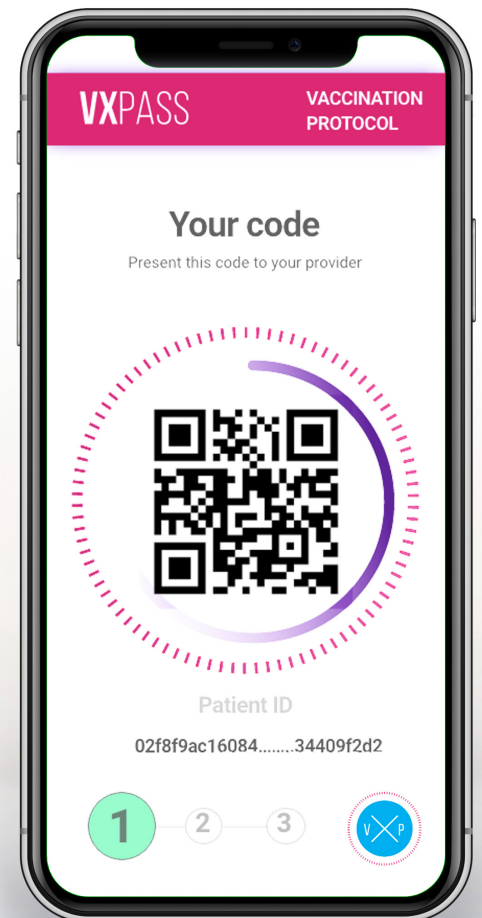

Patients using this protocol are NOT required to visit the same location for the second dose. The tokenized vaccination protocol allows patients to receive care from any vaccination center that utilizes VXPASS.

VXPASS frees government, HCPs, insurers, and pharmaceutical companies of the burden of building an infrastructure to handle this unprecedented influx.

VXPASS accurately facilitates the tracking of the second dose and certifies its completion (or flags its absence) within the specified time period. It is vaccine-specific to assure that the correct vaccine and dose were administered on schedule. This is critical for the estimation of coverage, speed of the process, and progress in population immunity.

Global, novel problems will only be tackled by novel and simple solutions.

Your low cost, secure solution to ensure COVID vaccination regimens are complete and verified

We look forward to demonstrating the process at your convenience.
